

LeapTalent Level 3 End-point Assessment

Employment by Industry

Scenario Demonstration — Pack Introduction

Difficulty: 5 of 5 — Advanced

What this pack is

This is a practice Scenario Demonstration pack modelled on the City & Guilds 9665 Data Technician end-point assessment. It contains four parts: this introduction, the Scenario Demonstration brief, the data files, and a Learner Guide showing how the task can be approached and the results you should expect to reach.

What is being looked at

This is the most demanding scenario in the series. It uses real-world, awkwardly structured data and asks for open-ended analysis including correlation and forecasting. The areas examined are:

Area examined	Where it appears
Importing data from multiple formats (CSV, XLSX, document table)	Scenario 1, Task 1
Reshaping messy source data (multi-row headers, grouping rows)	Scenario 1, Task 1
Appending two data sets and adding an identifier column	Scenario 1, Task 2 (Gender)
Validation: placeholders, duplicates, naming consistency, data types	Scenario 1, Task 3
Transforming text labels into proper dates	Scenario 1, Task 4 (quarter → date)
Trend analysis over time with summary statistics	Scenario 2, Tasks 1–2
Comparative analysis (gender, sector)	Scenario 2, Tasks 2–3
Identifying patterns, outliers and structural breaks	Scenario 2, Task 4
Correlation analysis between variables	Scenario 2, Task 5
Forecasting future values from a trend	Scenario 2, Task 6

Why this is rated 5 stars

Three things make this the hardest tier. First, the source files are genuinely messy — several header and grouping rows sit above the data and must be reshaped before anything else. Second, the analysis is open-ended: correlation and forecasting have no single "right answer", so the learner must choose an appropriate method and justify it. Third, the date standardisation and the placeholder (..) handling are easy to get wrong in ways that quietly corrupt every later result. It demands sound judgement at every stage, not just following steps.

Areas to watch

- The files have **multiple header rows** above the data — remove them and promote the real header before doing anything else.
- Early periods (pre-1997) use .. as a placeholder for "no data" — don't treat it as zero; replace with null so figures stay numeric.
- Employment figures are stored with **thousands separators** ("13,941") — they must be parsed to numbers, not left as text.
- When appending men's and women's data, **add a Gender column** so the two can be told apart.
- Convert quarters to the **last day** of the quarter (Annex A), not the first.
- State the **assumptions** behind any forecast — a linear trend is a choice, not a fact.

What's in the pack

- **Scenario Demonstration – Employment by Industry** (PDF) — the brief, in C&G format.
- **Employment by industry - men.csv** — men's employment series.
- **Employment by industry - women.xlsx** — women's employment series.
- **Annex A – Quarter-to-Date Reference** — third source, embedded in the brief.
- **Learner Guide – Employment by Industry** (PDF) — method and expected results.
