

LeapTalent Level 3 End-point Assessment

Data Technician

SAMPLE

Assessment Method:

Scenario Demonstrations with Questioning

90 minutes (for Scenario 1 and 2)

Scenario Demonstration 1 – Data Gathering and Validation

45 minutes

You are an analyst for a technology firm that sells computers and smartphones in France, the United Kingdom and China. Each country's sales for December 2018 are recorded by a different representative, in the local currency. You have been asked to validate and prepare this data, converting all values to a common currency (euros) ready for analysis.

You have been provided with the following data sources: **Jake.csv** (France), **Liam.xlsx** (United Kingdom), **Nick.csv** (China), the **Exchange Rates.xlsx** file, and the **December 2018 Exchange Rates** table in **Annex A**. Using a suitable data analysis tool of your choice, carry out the following:

Task 1 — Import the data sources

- Import the three sales files and the exchange rates file into your chosen tool.
- Review the headers and formats — note that the exchange rates file has several title rows and is arranged with months down the rows and currencies across the columns.

Task 2 — Validate the data

- Check each source for errors or typos, inconsistent formatting (date or number formats), and any missing or null values.

Task 3 — Combine the sales files

- Combine Jake, Liam and Nick into one data set, ensuring the column headers align.
- Add a column to identify the **representative** (or country) for each row.

Task 4 — Add the exchange rates

- Reshape the exchange rates file and select only the rates for **December 2018**.
- Join the rates onto the combined sales data using the **Currency** field as the key.

Save the prepared data set with a clear name (for example, **Combined_Sales_2018.xlsx**).

Scenario Demonstration 2 – Data Analysis

45 minutes

Using the combined sales data and exchange rates from Scenario Demonstration 1, carry out the following calculations and analysis, presenting your findings in a format suitable for senior management.

Task 1 — Unit price in euros

- Add a column **Unit Price EUR** using: $\text{Unit Price EUR} = \text{Unit Price (local)} \div \text{Exchange Rate}$.
- Format to 2 decimal places, and make sure each rate is matched by currency.

Task 2 — Revenue

- Add a column **Revenue** using: $\text{Revenue} = \text{Unit Price EUR} \times \text{Quantity}$.
- Check for any null values in Quantity or Unit Price EUR before calculating.

Task 3 — Analyse performance

- Identify the best-performing representative by total revenue.
- Identify the product that generated the most revenue.
- Calculate the average revenue for each product.
- Present your results using tables, summary statistics and charts.

Annex A – December 2018 Exchange Rates

These are the exchange rates into euros (EUR) for December 2018. Use them in Scenario 1, Task 4 and to convert local prices to euros in Scenario 2. EUR is the base currency (rate = 1). Two further currencies (BRL, MAD) are shown for completeness but are not used by any representative.

Currency	Rate into EUR (Dec 2018)
EUR	1.000000
GBP	0.897525
CNY	7.839751
BRL	4.422776
MAD	10.790000
