

**9665-12 City & Guilds Level 3 End-point Assessment for
ST0795/AP01**

Data Technician

SAMPLE

Assessment Method:

Scenario Demonstrations with Questioning

90 minutes (for Scenario 1 and 2)

Scenario Demonstration 1 – Data Gathering

45 minutes

You are currently employed by Just Money, a small financial company based in the UK, as a data technician. The company records all credit card and loan requests and is preparing the latest batch of applications for further analysis.

As part of this process, you have been asked to correlate the information provided in the Loan Data file, the Personal Data file and the Branch Reference table (Annex A) into common fields to generate a single aggregated data set named '**Loan Request Data**'.

To carry out this task, please use the data sources provided: **Loan Data.csv**, **Personal Data.xlsx** and the Branch Reference table in **Annex A**. The Loan Data file includes the latest loan requests; the Personal Data file includes personal details of those making the requests; Annex A maps each property area to its servicing branch.

Using a suitable data analysis tool of your choice, carry out the following:

- Import the columns **Gender**, **Married**, **Dependents**, **Education** and **Self-Employed** from the Personal Data file into the Loan Data file, matching on **Loan_ID**.
- Import the **Regional Office** and **Servicing Team** from the Annex A Branch Reference table, matching on **Property_Area**.
- Format the '**Applicant Income**' and '**Loan Amount**' columns to currency, 2 decimal places.
- Check all of the data and, where any **blanks** are identified, delete those records.
- Format the table so that it is presentable for further analysis.

Once you have aggregated the data, it should be reviewed to identify any patterns and trends that can be used to inform the analysis. Your findings and any actions taken should be documented so that they are available for the team undertaking the analysis of the data.

Scenario Demonstration 2 – Data Analysis and Validation

45 minutes

Using the aggregated '**Loan Request Data**' set from Scenario Demonstration 1, analyse the information to identify the following:

- the **monthly payment** due against each loan;
- the **number of male and female applicants**;
- the **total loan amounts** for married male and married female applicants.

To do this, carry out the following:

- Insert a new column to the right of '**Loan Amount Term**' headed '**Monthly Payment**'.
- In the new column, create a formula to calculate the monthly payment against the loan amount, formatted to currency, 2 decimal places.
- In cell **O2**, use a formula to calculate the number of male applicants, and in cell **O3** a formula to calculate the number of female applicants.
- Create a visual representation to show the total loan amounts for **married** male and female requests.
- Record your findings beneath the visualisation.
- Save the work.

Your findings should be documented in a format that is appropriate for presentation to senior management.

Annex A – Branch Reference

This table shows the servicing branch associated with each property area. It should be imported into the aggregated data set by matching on the **Property_Area** field.

Property_Area	Branch Code	Regional Office	Servicing Team
Urban	BR-100	London Central	Team A
Semiurban	BR-220	Midlands Hub	Team B
Rural	BR-340	Northern Hub	Team C
