

LeepTalent Level 3 End-point Assessment

Data Technician

SAMPLE

Assessment Method:

Scenario Demonstrations with Questioning

90 minutes (for Scenario 1 and 2)

Scenario Demonstration 1 – Data Gathering and Validation

45 minutes

You are a data technician at Trendy Threads Ltd, an independent fashion retailer with both online and high-street stores. Management want to understand how different product lines and customer segments performed last quarter to plan their winter promotions.

You have been provided with the following data sources: **SalesData.csv** (individual sales transactions) and **CustomerProfiles.csv** (customer details and demographics), plus the **Field Reference** table in **Annex A**. Using Microsoft Excel, carry out the following:

Task 1 — Import and set up

- Import both CSV files into Excel and save the workbook as **TrendyThreads_Analysis.xlsx**.
- Check for import errors or blank rows, and confirm the **CustomerID** field is consistent across both files.

Task 2 — Validate and clean

- Remove any duplicate rows from **CustomerProfiles**.
- Confirm dates in SalesData are consistently formatted as **dd/mm/yyyy**.

Task 3 — Blend the data

- Use **XLOOKUP** to bring **CustomerType** and **Region** from CustomerProfiles into SalesData, matching on **CustomerID**.
- Verify that every transaction has a matching customer record.

Save the cleaned, blended data set before moving to Scenario 2.

Scenario Demonstration 2 – Data Analysis

45 minutes

Using the prepared data set from Scenario Demonstration 1, carry out the following analysis and present your findings in a format suitable for senior management at Trendy Threads Ltd.

Task 1 — Calculated columns and Pivot Tables

- Add a **TotalCost** column: Quantity × UnitPrice, formatted to currency (2 dp).
- Insert a Pivot Table showing **Total Sales by Product Category**.
- Insert a second Pivot Table showing **Average Order Value by Customer Type**.

Task 2 — SUMIFS and IF flag

- Use **SUMIFS** to total sales by region (use the UNIQUE function to list all regions exactly as they appear before building the formula).
- Add a **HighValue?** column using **IF**: flag orders where TotalCost exceeds £100 as "High Value", otherwise "Standard".

Task 3 — Visualise

- Build a **column chart** of total sales by product category.
- Add a **pie chart** showing the share of High Value vs Standard orders.
- Apply **conditional formatting** to the region summary to highlight regions performing above the average.

Task 4 — Interpret and communicate

- Identify which category generated the most revenue and which customer type tends to spend more.
- Write a short paragraph (3–4 sentences) summarising key findings and one action Trendy Threads could take based on the data.

Annex A – Field Reference

This table describes the fields across the two data sources. The two files are linked by **CustomerID**.

Field	Source	Description
TransactionID	SalesData	Unique transaction identifier
CustomerID	both	Unique customer identifier — the key linking the two files
ProductCategory	SalesData	Product line (Shoes, Jackets, T-Shirts, Jeans, Accessories)
Quantity	SalesData	Number of units sold
UnitPrice	SalesData	Price per unit in GBP
OrderDate	SalesData	Date of transaction (dd/mm/yyyy)
CustomerType	CustomerProfiles	Online or Store customer
Region	CustomerProfiles	UK region of the customer
Gender, Age	CustomerProfiles	Customer demographics
