

LeapTalent Level 3 End-point Assessment

Data Technician

SAMPLE

Assessment Method:

Scenario Demonstrations with Questioning

90 minutes (for Scenario 1 and 2)

Scenario Demonstration 1 – Data Gathering and Validation

45 minutes

You are a data technician working for StreamScene Analytics. The company is studying viewing behaviour across the major streaming platforms (Netflix, Disney+ and Prime Video) and has asked you to blend its viewing statistics with its user profiles to produce a single data set ready for analysis.

You have been provided with the following data sources: **ViewingStats.csv** (viewing statistics), **UserProfiles.csv** (user profiles), and the **Field Reference** table in **Annex A**. Using Microsoft Excel, carry out the following:

Task 1 — Import and set up

- Import both CSV files into Excel. Rename the sheets **Profiles** and **Stats**.
- Save your workbook as **Streaming_Wars_Report.xlsx**.

Task 2 — Validate the data

- Review both sources for consistent headers and formats, and check for any missing values or duplicate UserIDs before blending.

Task 3 — Blend the data (XLOOKUP)

- In the Stats sheet, use **XLOOKUP** to bring **Gender** and **AgeGroup** across from the Profiles sheet, matching on **UserID**.

Task 4 — Flag the cost level (IF)

- Add a new column **HighCost?** using **IF**: label a subscription cost over £9 as "High", otherwise "Standard".

Scenario Demonstration 2 – Data Analysis

45 minutes

Using the blended data set from Scenario Demonstration 1, carry out the following analysis and present your findings in a format suitable for non-technical stakeholders.

Task 1 — Total viewing hours (SUMIF)

- Use **SUMIF** to calculate the total hours watched for each platform.

Task 2 — Average satisfaction by platform (AVERAGEIF)

- Use **AVERAGEIF** to find the average satisfaction score for each platform.

Task 3 — Satisfaction by gender and platform (AVERAGEIFS)

- Use **AVERAGEIFS** to compare average satisfaction for combinations such as Female + Netflix or Male + Disney+. Build a small results table and highlight the differences.

Task 4 — Pivot Table (age × platform)

- Insert a Pivot Table showing the **Average of HoursWatched** by AgeGroup (rows) and Platform (columns).

Task 5 — Pivot Chart

- Add a clustered column chart from the Pivot Table, titled "Average Viewing Hours by Age Group and Platform".

Task 6 — Summary table and write-up

- Build a summary table comparing Platform, Total Hours, Average Satisfaction and Cost Level, using conditional formatting or icons to make the story clear.
- Write a short plain-English summary (3–5 sentences): which platform performs best, whether cost affects satisfaction, and any patterns by gender or age.

Annex A – Field Reference

This table describes the fields across the two data sources, to help you blend and validate them correctly in Scenario 1. The two sources are linked by **UserID**.

Field	Source	Description
UserID	both	Unique user identifier — the key linking the two files
Name, Gender, AgeGroup, Country, PreferredPlatform	UserProfiles	User profile attributes
Platform	ViewingStats	Platform the viewing relates to
HoursWatched	ViewingStats	Total hours watched
SatisfactionScore	ViewingStats	Satisfaction rating (1–10)
SubscriptionCost (£)	ViewingStats	Monthly subscription cost in pounds
