

LeapTalent Level 3 End-point Assessment

Data Technician

SAMPLE

Assessment Method:

Scenario Demonstrations with Questioning

90 minutes (for Scenario 1 and 2)

Scenario Demonstration 1 – Data Gathering and Validation

45 minutes

You are a data technician working for the Department of Unexplained Phenomena (DUP). The department is reviewing recent UFO sighting reports collected by field agents. The data is messy and inconsistent, and your task is to clean it, blend it with the agent records, and prepare it for analysis to help identify credible patterns.

You have been provided with the following data sources: **SightingReports.csv** (UFO sightings), **AgentProfiles.csv** (investigation agents), and the **Field Reference** table in **Annex A**. Using Microsoft Excel, carry out the following:

Task 1 — Import and set up

- Import both CSV files into Excel and save the workbook as **XFiles_Analysis.xlsx**.
- Confirm the column headers are visible and that both tables share a matching **AgentID** field.

Task 2 — Inspect the data for problems

- Use sort and filter to identify inconsistencies — variation in capitalisation, extra spaces, blank rows, duplicate Agent IDs, and any missing values.

Task 3 — Clean the data

- Tidy the text using **TRIM** (remove extra spaces), **PROPER** (consistent capitalisation of names and locations) and **UPPER** (consistent codes/status).
- Remove any duplicate rows, and reconcile any mis-spelled or inconsistent region names.

Task 4 — Blend the data

- Use **XLOOKUP** (or **VLOOKUP**) to bring the agent's **Region** and **ExperienceYears** into the **SightingReports** table, matching on **AgentID**.
- Check that every lookup returns a valid match — where one does not, state why.

Save the cleaned, blended data set ready for analysis.

Scenario Demonstration 2 – Data Analysis

45 minutes

Using the cleaned and blended data set from Scenario Demonstration 1, carry out the following analysis and present your findings in a format suitable for senior management.

Task 1 — Add calculated columns

- **Classification** — use **IF** to mark "High Credibility" where the score is 80 or more, otherwise "Medium Credibility".
- **Adjusted Duration** — divide Duration by ExperienceYears (time per experience level), formatted to 2 decimal places.

Task 2 — Apply conditional formatting

- Highlight Credibility Score over 90 (green) and Duration over 120 minutes (orange) to spot the most interesting and time-intensive cases.

Task 3 — Regional insights

- Use **AVERAGEIF** for the average credibility score per region, and **SUMIF** for the total duration of confirmed cases.

Task 4 — Pivot Table and Chart

- Insert a Pivot Table with Region as rows and values of Average Credibility and Count of Sightings.
- Create a Pivot Chart (column or bar) named **Regional_Credibility_Chart**.

Task 5 — Interpret your findings

- Write a short summary: which region reported the most credible sightings, and whether more experienced agents are linked to higher-credibility reports.

Annex A – Field Reference

This table describes the fields across the two data sources, to help you clean, blend and validate them in Scenario 1. The two sources are linked by **AgentID**.

Field	Source	Description
AgentID	both	Unique agent identifier — the key linking the two files
AgentName, Region, ExperienceYears, Status	AgentProfiles	Agent details
SightingID	SightingReports	Unique sighting identifier
Date, Location	SightingReports	When and where the sighting occurred
DurationMins	SightingReports	Length of the sighting in minutes
CredibilityScore	SightingReports	Assessed credibility (0–100)
EvidenceType	SightingReports	Type of evidence (photo, video, audio, eyewitness, none)
